Abstract (en)

[origin: WO2011092150A1] The invention relates to a device and method for pattern projection for the optical measurement of a mobile or immobile measuring object (2), wherein a rotating, analog light modulator (4) is provided, which projects light in a spatially and temporally modulated manner as a measuring pattern onto the measuring object (2) to be measured by means of a projection lens (5), wherein the projected measuring pattern is recorded by a camera (6) for generating a data model of the measuring object.
