Abstract (en)

[origin: EP2532820A2] The section (28) has two conductors (32, 34) coming into contact with each other in a compression state of the section and spaced apart from each other by an obstacle to be detected in an uncompressed state of the section. The conductors are arranged perpendicular to a longitudinal direction relative to a center plane (46) of the section for outputting direction-selective switching signals to a cavity (30). The conductors are arranged at a fastening-side (42) and an obstruction-side (44) of the section, respectively. A sealing profile is asymmetrically arranged in a region of the cavity. An independent claim is also included for a method for detecting obstacles impinging on a hollow section.
