Abstract (en)
[origin: WO2011099924A1] The present invention relates to a swimming float (10) adapted for temporarily being applied to the arm (11, 12) of a user. The swimming float (10) comprises at least en float body (30) and at least one attachment arrangement. The attachment arrangement and a first part (35) of the float body (30) define a first plane (X-Y). A second part (36) of the float body (30) has a first curvature and thereby an extension in an additional direction (R3). The second part (36) is arranged at the extension of the first part (35) and the additional direction (R3) is in a direction away from the first plane (X-Y) and in a direction towards the shoulder (3) or back (2) of said user (1) following said application to the arm (11, 12) of said user. The swimming float (10) according to the present invention provides a buoyancy which is displaced out towards the back section of the user, which makes the buoyancy of the swimming float advantageously situated in relation to the user (2). This increases the feeling of safety and facilitates learning during swimming and bathing.
