Abstract (en)
[origin: WO2011096938A1] A multi-wheeled vehicle has an electric parking brake (EPB) responsive to a control signal to selectably apply braking following parking of the vehicle. An input element generates a command signal in response to manual actuation by a person outside the parked vehicle. A controller validates the command signal and, if valid, then generates the control signal to temporarily release braking so the vehicle can be moved a short distance in the parking area.
