Abstract (en)  
[origin: WO2011098691A1] The invention relates to a device (10) for transporting and/or storing a motor vehicle part, wherein said device includes a mounting (12), comprising two parallel longitudinal rails (16) and a support system (14) intended to be suspended between both rails (16). The support system (14) includes a hollow sack (22), for receiving the part, and two side hooks (24) that are attached onto the sack (22). Each hook (24) defines a longitudinal cavity, for receiving a rail (16), and a slit for inserting the rail (16) into the cavity. Said device is characterized in that at least one of the hooks (24) is capable of pivoting around the rail (16) when the rail (16) is received in the cavity between a removing position, in which the rail (16) can be removed from the cavity through the slit, and a locked position, in which the hook (24) is locked onto the rail (16).
