Abstract (en)

[origin: WO2011098445A2] The invention relates to a method for predetermining a motion state (BZ_{n+1}) of a drive shaft (222) of an internal combustion engine (210) on the basis of previous motion states (BZ_n, BZ_{n-2}) of the drive shaft (222), wherein properties (t_{n-2}, ?_{n-2}) allocated to a first previous motion state (BZ_{n-2}) and properties (t_n, ?_n) allocated to a second previous motion state (BZ_n) are used and the drive shaft (222) assumes periodically recurring angular positions (f_{n-2}, f_n, f_{n+2}; f_{n-1}, f_{n+1}). The invention is characterized in that a future motion state (BZ_{n+1}) and the properties (t_{n+1}, f_{n+1}) allocated thereto of the drive shaft (222) are determined in an angular position on the basis of the first evaluated previous motion state (BZ_{n-2}) and the second evaluated previous motion state (BZ_n), wherein the angular position (f_{n+1}) of the determined future motion state (BZ_{n+1}) of the drive shaft (222) is not equal to an angular position (f_{n-2}, f_n) of the first and second previous motion state (BZ_n, BZ_{n-2}).
