Abstract (en)

A method for cross rolling of products such as balls, in particular the ones obtained from heads of scrap railway rails, whereby billet (1) in the form of a head cut off a scrap railway rail is placed between two flat tools (2) and (3) which have initial wedges (4) and (5), behind which there are wedges (6) and (7) which have longitudinal grooves (8) and (9) of a semicircular profile, next the flat tools (2) and (3) begin to move in the opposite directions with the same velocity (V), and during this time the moving initial wedges (4) and (5) cut into the billet (1) and make it rotate, thereby forming a semi-finished product (10) which has the form of a rod whose diameter (D1) is bigger than or equal to the diameter (D2) of a ball (11), next the wedges (6) and (7) with the grooves (8) and (9) cut into the semi-finished product (10) and form the balls (11), which are in the final stage of the rolling process separated from one another by cutters (12) and (13) located at the end of the flat tools (2) and (3). The process is done in a configuration wherein only one of the flat tools (2) or (3) moves in a sliding motion with the velocity (V), while the other tool (2) or (3) does not move.
