Abstract (en)

[origin: WO2011105899A1] A guard device (10,20) for an intravenous body (42) for use around a percutaneous infusion port in a peripheral body part comprises a hollow, substantially form-retaining guard body (10) open on at least one side which is intended and adapted to receive the intravenous body thereunder. The guard body (10) comprises at least a first shell part (11) and a second shell part (12) which are connected for adjustment relative to each other. The two shell parts (11,12) can thus be adjusted to different angles relative to each other so as to optimally match the natural anatomy of the body part.
