Abstract (en)

[origin: WO2011104227A1] A method for manufacturing stratified panels made of stone-like material and glass, particularly for providing furniture components or light diffusers, which comprises a step of mating, on at least one face of a slate of stone-like material (1), at least one tempered glass plate (2), whose dimensions are smaller than those of the slate of stone-like material (1), and a step that consists in making the tempered glass plate (2) adhere firmly to the slate of stone-like material (1). Subsequently, there is a step of removing the portion (1a) of the slate of stone-like material (1) that protrudes with respect to the tempered glass plate (2) by means of a progressive removal of material performed along a direction that has at least one component which is substantially perpendicular to the perimetric edge of the slate of stone-like material (1), until the perimetric edge of the slate of stone-like material (1) is substantially flush with the edge of the tempered glass plate (2).
