Abstract (en)
[origin: WO2011104204A1] The aim of the invention is to provide a device (1) for hardening resin with which a winding body (4) of a high-voltage duct has been impregnated, said device comprising a reaction chamber (2) designed to receive the winding body (4) and defined by a reaction chamber housing (3), and heat exchanging means (6) for cooling or heating the reaction chamber (2), the resin of the winding body (4) being able to be hardened by said device, without the formation of cavities or stress. To this end, the heat exchanging means (6) are designed for direct heat exchange with both the reaction chamber (2) and the winding body (4).
