Abstract (en)

[origin: US2011207094A1] The speech perception of hearing-aid wearers and wearers of other hearing devices is intended to be improved. To this end, a method for training the speech perception of a person, who is wearing a hearing device, is provided, in which a first speech component is presented acoustically and the latter is identified by the person wearing the hearing device. Subsequently, there is automated modification of the acoustic presentation of the presented speech component and the aforementioned steps are repeated with the modified presentation until, if the identification is incorrect, a prescribed maximum number of repetitions has been reached. Otherwise, if the first speech component is identified correctly or if the number of incorrect identifications of the first speech component is one more than the maximum repetition number, a second speech component is presented acoustically. This allows a plurality of speech components to be trained in respectively a number of steps.
