Abstract (en)  
[origin: WO2011107297A2] The present invention relates to an electromechanical motor having a rotor which can be rotated about an axis of rotation, at least one drive element which can be displaced so as to revolve about the axis of rotation such that the rotor can be rotated by displacement of the drive element, at least two actuators each having a first active element, with which a force acting in the effective direction can be exerted on a second active element, wherein in each case the first and the corresponding second active element are not connected to each other, and wherein the drive element for rotating the rotor can be displaced by the action of force from the at least two actuators.
