Abstract (en)
[origin: EP2543304A1] A dishwashing machine of the present invention comprises a water feed valve as a water supply unit for supplying water into a washing tub, a water level detector for detecting a water level of the washing water supplied in the washing tub, and a controller unit. The controller unit measures a time of supplying the water until the water level detector detects the water level after the start of water supply through the water feed valve. The controller unit supplies supplemental water by continuing supply of water for a predetermined time period after the water level detector detects the water level, and changes a time of supplying the supplemental water for a rinsing step based on a difference in the time of supplying water between a washing step and the rinsing step.
