Abstract (en)
The device (1) has cuts (6) laid out to form marks of a concentric site of an opening of a lamp mounted on a bottom layer of a ceiling system. Load of the device and load of the lamp are transmitted to a support structure of the ceiling system, where the device supports a capping device to surround the lamp to protect the lamp from an insulating material filled in thickness of the ceiling system and receives a spacer element with a plastic tube for a passage of electric cables. Breaking points (12) define separable portions to form a recess corresponding to a location of the lamp. An independent claim is also included for a method for fixing a lamp.

Abstract (fr)
Un dispositif de plaque (1) agencé de façon à pouvoir supporter une lampe (20) apte à être montée sur une couche basse d'un système de plafond, ledit dispositif de plaque étant apte à reposer sur le système de plafond de façon à transmettre sa propre charge et la charge de la lampe à une structure porteuse (60) du système de plafond.
