Abstract (en)

[origin: WO2011110469A1] It is disclosed a container for a sample of a physiological liquid. The container comprises a collecting body in turn comprising: a lower portion comprising at least two sub-containers having respective openings and being suitable for collecting respective sample portions of the sample, the lower portion further comprising an upper edge interposed between said openings; and an upper portion connected to the lower portion so as to form an annular edge encircling the openings and being substantially flush with the upper edge. The container further comprises a gasket keeper and a gasket fixed thereto, the gasket keeper being conformed so that, when it is housed in the upper portion with the gasket fixed thereto, the gasket leans against the annular edge and the upper edge for hermetically sealing the at least two sub-containers. The container further comprises a cover suitable for engaging with the upper portion for irreversibly closing the container.
