Abstract (en)
[origin: WO2011110473A1] The invention relates to a locking cylinder housing (26) having a first locking channel (34) for receiving the first tumbler (18) and a second locking channel (36) for receiving the second tumbler (20). According to the invention, a width (a) of the first tumbler (18) transverse to the radial direction of motion is greater than an opening width (b) of the second locking channel (36) transverse to the radial direction of motion. The first tumbler (18) can thereby not slide into the second locking channel (34), so that undesired removal of the key (10) from the locking system (24) at an undesired position is prevented.
