Abstract (en)

[origin: WO2011110143A2] The invention relates to a lock for a motor vehicle, comprising a locking mechanism, which has a rotary latch, which is rotatably supported on a rotary latch shaft and which can receive a locking bolt, and a pawl. Compared to prior art, the lock comprises additional means in order to transmit forces from a rotary latch into the lock case of the lock via the additional means. Altogether, this measure makes it possible to construct a compact, light lock.
