Abstract (en)

[origin: EP2546452A2] The device (12) has a magnet (27) generating a magnetic field for moving a detector (28) during a relative movement of a member (17) i.e. base, with respect to another member (16) i.e. button, between two positions of the device. A transformation unit (29) transforms the relative movement of the former member relative to the latter member to another relative movement of the magnet relative to the detector along a path. The path comprises a rotational component that rotates between the two positions of the device.
