Abstract (en)
A malfunction detection device for an engine detects whether a pressure reducing valve (6) that discharges fuel from a fuel system of an engine to reduce fuel pressure in the fuel system is stuck closed. The malfunction detection device is configured to provide a valve opening command to open the pressure reducing valve (6) after the engine is stopped, detect an amount of reduction in the fuel pressure per unit time before the valve opening command is provided and an amount of reduction in the fuel pressure per unit time after the valve opening command is provided, and determine whether the pressure reducing valve (6) is stuck closed based on the detected amount of reduction in the fuel pressure per unit time before the valve opening command is provided and the detected amount of reduction in the fuel pressure per unit time after the valve opening command is provided.
