Abstract (en)

[origin: WO2011138647A1] The invention relates to a dynamic striking device designed to be secured to devices used to collect standardized cones, such as a roller or belt conveyor arranged in a known manner at the rear of the collection vehicle or extending along a side wall of the vehicle, and terminating at a side door where the operator is stationed. The device is fitted and secured to the side walls of a cone conveyor. Said device comprises a technical striking means (solidly connected to the collection vehicle, thereby generating the movement of the striker and consequently the impact against the cone), said striking means taking the form of a cone striker that can move forwards (AV) and backwards (AR), AR denoting the usual but non-limiting direction in which the collection vehicle travels.
