Abstract (en)

[origin: WO2011113636A1] The invention relates to a method for detecting blocking or sluggishness (M1, M3) of a DC motor (2). The method comprises the following steps: applying a voltage pulse ($U_{v,t} = 0s$) to the DC motor (2); monitoring a motor current (I_{Motor}) flowing through the DC motor (2); detecting a maximum value of the motor current (I_{Motor}) following the application of the voltage pulse; checking whether a change in the motor current (I_{Motor}) after reaching the maximum value exceeds a specific amount; signalling the blocking or the sluggishness (M1, M3) of the DC motor (2) if the change in the motor current (I_{Motor}) after reaching the maximum value exceeds the specific amount.
