Abstract (en)
[origin: WO2011117149A1] The invention relates to a trigger diffuser to be attached to the neck of a vial provided with an outlet valve. The diffuser comprises fixation means for attaching the same to the vial, actuation means for actuating the vial valve, a trigger (200) that can be moved between a neutral position, in which the actuation means do not actuate the valve, and a diffusion position in which the actuation means are moved towards the valve while actuating the same, and an outlet channel for conveying outside the diffuser the product exiting the valve when the latter is actuated. The purpose of the invention is to provide a diffuser according to the preamble, which can be stored without the trigger being accidentally operated. The aim of the invention is reached because the receiver further comprises blocking means (304) that can be moved between a blocking position, in which said blocking means block the movement of the trigger (200) and prevent the same from reaching the diffusion position, and an unblocking position in which the trigger can be moved from the neutral position to the diffusion position. Such means make it possible to block the trigger (200) even after a first use.
