Abstract (en)

[origin: US2011238608A1] An approach is provided for suggesting information resources based on context, preferences, and group behavior of a community, culture, country, or combination thereof that the user belongs to. A recommendation application applies one or more rules to select a weight value for tokens within a language topology based upon group behaviors of a community, culture, country, or combination thereof that a user belongs to. The recommendation application adjusts semantic structures of a plurality of information resources based upon the weighted topology. The recommendation application suggests one or more of the information resources to the user based, at least in part, on the adjusted semantic structures.
