Abstract (en)

[origin: EP2551225A1] The method involves operating two collecting sections (21, 30) in operative connection with a conveyor element (20) i.e. conveyor wheel. Printed sheets (a1-e1), main products (HP) and preliminary products (VP) i.e. advertisement supplements, are formed along the sections. The sheets are conducted to retaining bags (22) in a subsequent cycle sequence. The bags are provided with holding devices. The bags are loaded with the products from one of the sections (30) and with the sheets from the other section (21) to form a completely formed end product.
