Abstract (en)  
[origin: EP2551618A2] The present invention discloses a cooling device (S) which comprises at least two sections having temperature values different from each other. Said cooling device (S) comprises an outer body (S1); at least one internal volume (2) which is formed by the outer body (S1) and in which the products to be cooled are placed; at least one drawer compartment (C) which is positioned in the internal volume (2), which comprises at least one outer body (C1) and at least one chamber (3) which is placed in at least one internal region (C2) formed by the outer body (C1) and which is able to move inside the region (C2) by sliding; at least one separator (5) which is positioned in the chamber (3) and which forms at least two compartments (4) having temperature values different from the internal volume (2) inside the chamber (3); air holes (6) which allow air passage between the internal volume (2) and the chamber (3) and which are provided on the outer body (C1).
