Abstract (en)
[origin: WO2011121025A1] A push-out apparatus, in particular for moving furniture parts, for example for a pull-out guide (2) for a drawer (1), comprises a latching mechanism by means of which a first driver (8) can be latched in a closed position by virtue of the force of a first spring (13), wherein the first driver (8) can be moved along a guide (9) and can be coupled to an activator (6) which is connected to a running rail (5) of a pull-out guide (2). The latching mechanism can be unlocked in order to move the driver (8) in the opening direction together with the activator (6), wherein at least a second driver (10) is provided, said second driver being prestressed in the opening direction by means of a second spring (14) and it being possible for said second driver to be moved along a guide (11) between two end positions in order to engage with an activator (6, 60), which is connected to a moving furniture part, at a distance from the closed position.
