Abstract (en)  
[origin: WO2011116873A1] According to the invention, an explosive body (1) is not surrounded by a film or the like, but rather is encapsulated in such a way that the encapsulation or casing (2) supports the ignition behavior of the explosive body or of the components (3, 4). The novel explosive body (1) thus is characterized by a casing (2) for accommodating the components (3, 4) of the explosive body (1), which differ with regard to the chemical composition and the properties thereof. An additional component (5) is located in the casing (2) as an ignition aid. The explosive body (1) can be ignited through the top/side surface (10) of the casing (2) or by means of an internal ignition mixture (6) located inside the explosive body (1).
