Abstract (en)

[origin: EP2554773A2] The sealing tape (1) comprises two opposite lying broad sides (2,3) for sealing contact at the two components, and two narrow sides (4,5) connected to the broad sides, on which a space interior side and the other space exterior side are arranged. The area of one of the narrow sides is provided with a coating material (10). The sealing tape is resiliently formed. The coating material is an activatable coating material, which is transferred starting from a preactivation condition by the activation of the coating material into a sealing condition. Independent claims are included for the following: (1) a building joint comprises a gap; and (2) a method for sealing of building joints between a primary component and a secondary component, such as a frame profile and a wall portion.
