Abstract (en)

[origin: EP2554776A1] The method involves moving an electric actuator (4) in a direction, where the movement is controlled by a sequence of a type. The actuator is moved in another direction, where the movement is controlled by an order of the type while the actuator is in a position. The sequence of movements is interpreted as a recording order of the position of the actuator as a particular position of the recording and production, where the movement of the actuator in the latter direction can be controlled by an order of another type. Independent claims are also included for the following: (1) an electric actuator for actuating a movable member for sun protection, privacy, closure or shield (2) a control interface for a movable member.
