Abstract (en)  
[origin: EP2557253A1] A design method for a building which enables an efficient design or construction and is environment-friendly by suppressing the occurrence of damaged materials to a minimum, and a building which can be constructed at a low cost are provided in such a manner that when the building is designed, a boundary surface in the height direction of a substantially effective width (working width) in an exterior member, a so-called siding panel, which occupies relatively high cost is set to be an indicator for determining an arrangement position of a window, a balcony, a canopy, further a main entrance or the like. When a building 1 is constructed, a lower limit position or an upper limit position of the attachment position of a window 11, a canopy, a balcony, a main entrance and a parapet which are arranged at an outer wall thereof is determined by setting a working width of exterior members 13a to 131 which are used in constructing the outer wall of the building 1 and have a constant shape, as an indicator.
