Abstract (en)
[origin: WO2011127975A1] The invention relates to a steam cleaning device (10), comprising a liquid tank (24), which is connected to an electrically heatable steam boiler (26), wherein the steam boiler has a safety valve (38), which opens at an impermissibly high steam pressure in the steam boiler (26). In order to further develop the steam cleaning device (10) in such a way that the danger of the user being adversely affected by steam exiting through the safety valve (38) is reduced and the handling of the steam cleaning device is simplified, the safety valve (38) is integrated into a detachable maintenance closure (36) and can be covered by a covering element (54), which can be moved back and forth between a closed position that covers the maintenance closure (36) and an uncovering position that uncovers the maintenance closure (36).
