Abstract (en)  
[origin: WO2011128864A1] A cooking appliance, in particular an oven, has a structure, articulated to which is a front door (5). Secured via fixing means (16-19) to a fore component (4) of the structure is a covering element (10) of a user interface. The door (5) and the covering element (10) are mounted on the structure in such a way that, in the condition where the door (5) is closed, defined between a lower edge (10a) of the covering element (10) and an upper edge (5a) of the door (5) is an interstice (G). The fore component (4) of the structure and the covering element (10) have means for mutual hooking (14-15), pre-arranged to provide between them a loose coupling, with play. The fixing means (16- 19) are pre-arranged for enabling the covering element (10) to be secured in a fixed position on the fore component (4) in one of a plurality of possible alternative positions allowed by the play provided by the hooking means (14-15).
