Abstract (en)

[origin: EP2559609A2] The frame has frame parts (14.1, 14.2) arranged between a roof frame (10) of a car body and a roof module (12) e.g. lifting roof, arranged in a roof, where the parts comprise flanges in vertical direction (Z) and are connected together. One part is firmly connected with the roof frame, and another part is connected with an outer part (18) of the roof. The flanges form a ring (20) rotating around the roof module, where the flanges are connected in force-fit manner. An allowance input is enabled in vertical direction during assembly of the reinforcing frame. An independent claim is also included for a method for attaching a reinforcing frame.
