Abstract (en)

[origin: EP2559833A2] The knob cylinder comprises a plug-in housing (1), a closure element (2) and a rotary knob (3) overlaid with coupling elements which exhibit clutch operation by shifting the push-button (6) from normal position such that the coupling elements separated from each other are brought into rotary driving position in which the coupling elements are engaged with each other, while the closure element is rotated by the knob. Another push-button is connected to the specified push-button through a gear such that rotational driving of buttons is achieved, according to position shift of buttons.
