Abstract (en)

[origin: WO2011131914A1] The present invention relates to a device for preparing and/or treating a biological sample comprising a set of storage chambers and/or of reaction chambers intended to receive a fluid, the chambers being separated by walls so as to constitute a set of adjacent chambers. It also relates to an analyser capable of using such a device and also to a method of using this device. The device comprises a base and a drawer comprising the set of adjacent chambers, the drawer being moveable relative to the base, the drawer comprising a contact surface onto which first fluid communication means connected to the volume of at least one chamber open, the contact surface of the drawer being intended to be positioned opposite a contact surface of the base comprising at least one position level with which second fluid communication means connected to detection means are positioned. The invention finds a preferential application in the medical diagnosis field.
