Abstract (en)  
[origin: EP2562113A2] The textile machine (1) has drive equipment (20) arranged on a drive shaft (35) that is extended over multiple work stations (2) of the textile machine. Two coaxial deflection- and guide grooves arranged with the drive shaft, where two strands of the drive shaft drawn around an endless tensile unit (19) are inserted in the grooves. The resulting loops of the endless tensile unit in the region of a corresponding cantilevered yarn processing unit (41) are guided in the deflection- and guide grooves of the output units (22). The output units are connected to the respective yarn processing units.
