Abstract (en)
[origin: EP2562342A2] The drive (1) has a position piston (14) guided into a working cylinder (4) for axial position movement in an axial position direction (17). A coupling mechanism (47) i.e. spindle drive, converts the axial position movement of the position piston into a pivoting movement (48) of a driving element (33). A sensor (59) is integrated in the drive to detect the axial position movement of the position piston. The position piston is not rotated over a guide bar (19), and the sensor is integrated partly into the guide bar. The sensor is a contactless sensor and a magnetostrictive sensor. An independent claim is also included for a method for operating of a vehicle door controller with a fluidic vehicle door pivot drive.
