Abstract (en)
[origin: US2011259884A1] The invention relates to a container for transporting and storing goods with a container base (2) and at least two side walls (4) that can be folded over one another, wherein the two side walls (4) that can be folded over one another are respectively pivotably supported through at least one hinge bolt (6) in a hinge bolt receiver (5), wherein the hinge bolt receiver (5) comprises an elongated recess (7), which extends in a direction perpendicular to the container base (2), wherein the folded down side wall (4) is movable from a lower end position, in which the folded down side wall contacts the container base (2), into an upper end position, which is displaced upward from the lower end position in a direction perpendicular to the container base (2). Thus, the hinge bolt (6) is provided with a guided translational movement when the side wall (4) is folded up from the lower end position, this means for a rotation of the hinge bolt (6) in the hinge bolt receiver (5), so that the side wall (4) moves upward in a direction perpendicular to the container base (2).
