Abstract (en)  
[origin: WO2011134680A1] In a mounting rail (1) for embedding in a curable building material (4), for example concrete (5), comprising a support profile (2) and a means (3) for fastening at least one attachment part to the mounting rail (1), such that, in an embedding region (6), an outer face of the support profile (2) has a direct connection to the curable building material (4), a potential break slab (20) should be large, such that large forces can be absorbed by the mounting rail (1). Said aim is achieved by fastening a layer (8), preferably a compressible layer, to the outer face of the support profile (2) at the embedding region (6), so that the outer face of the support profile (2) at the embedding region (6) has no direct contact with the curable building material (4) in some areas.
