Abstract (en)

[origin: CA2702472A1] A fluid heating and storage tank with an interior-installed heat exchanger is provided. The tank comprises two pairs of inlets and outlets for second fluid, and at least one breathing port, which are connected to the heat exchanger. One apparatus for condensing and reclaiming of the liquid vapor is mounted at the breathing port. A heat driven self-circulated fluid heating and storage system incorporating the fluid heating and storage tank is provided to use with one or two heaters. The heaters may use solar and other different energy resources. The system can have the double solar heat collectors orientated in any angle, typically in 90 degrees and 180 degrees. These solar heating systems may be used to form the module units of the building roofs, fences and verandas etc.
