Abstract (en)

[origin: WO2011137251A1] A trigger-based application control may be provided. An application trigger may be created and associated with a work area and a characteristic associated with a work implement. In response to determining that the work implement has entered the work area associated with the location-based condition if the characteristic of the work implement satisfies a condition associated with the application trigger, an application configuration may be transmitted to the work implement where it is received and initialized. In an agricultural inventorying and invoicing system a work task associated with an agricultural implement and a work area may be identified. If the agricultural implement is determined to be located within the work area, a work application for recording at least one data measurement associated with the work task may be initiated.
