Abstract (en)  
[origin: EP2565116A1] The apparatus has fin (5) that is moved from operating position into rest position to accommodate pocket (2) pivoted within the ship. The fin is formed as an elongated rectangle such that short side in operating position is parallel to the ship outer hull (1) and long side is provided with forward facing angled rearward sweep (10). The axis of fin is in the range 10-30% of an average chord length of the fin located in central span. The tapering of pivotal movement of pivot column (3) from operating position to rest position is greater than 90 [deg] to accommodate the pocket.
