Abstract (en)

[origin: WO2012031788A1] The invention relates to a printing unit of a rotary printing press, comprising a plate cylinder (02), an inking unit (06) that interacts with the plate cylinder (02) in the operating position, and a dampening unit (07) that interacts with the plate cylinder (02) in the operating position. The dampening unit (07) has a roll train having at least three dampening unit rolls (21; 22; 23), specifically a first dampening unit roll (21; 22; 23) that interacts with the plate cylinder (02) via a nip point in the operating position, a second that interacts with the first via a nip point in the operating position, and a third that interacts with the second via a nip point in the operating position. At least one of the three dampening unit rolls (21; 22; 23) is mounted in the printing unit (01) such that same can move in the radial direction, so that a sequence of rolls formed in the roll train in the operating position by the nip points between the three dampening unit rolls (21; 22; 23) can be brought into a sequence of the three dampening unit rolls (21; 22; 23) that is different from the first-named roll sequence by re-organizing the nip points between the three dampening unit rolls (21; 22; 23).
