Abstract (en)

[origin: US2011273768A1] A tunable multiple laser pulse scanning microscope and a method of operating the same is described, applying two pulsed laser beams with distinct wavelengths incident on a scanning spot of a sample to be imaged simultaneously or at a specific time delay. The microscope comprises at least two pulsed laser light sources emitting laser light of distinct wavelengths, an acousto-optic tunable filter (AOTF) for tuning at least one of the laser pulses, a delay stage provided upstream of the AOTF, and an actuator for moving delay stage depending on the time delay. As a result, the wavelength of at least one type of pulses is tuned, and the delay between at least two pulses of distinct wavelengths is adjusted.
