Abstract (en)

[origin: WO2011138759A1] The invention relates to a method for controlling safety in workplaces. As it is known, safety in factories, building yards, offices and in work environments in general is regulated by several laws and regulations, whose knowledge requires expertise and skills that are not always available. In order to overcome such situation, the invention teaches to control some parameters by means of indices, which can be studied and processed even by computerized means. By this method safety, that up to now has been mainly an abstract concept, and/or a concept analyzed and evaluated by systems taken and adapted from other sectors such as the economic one, now becomes a concrete result that can be applied in the industrial sector, even by means of electronic processing means, that arises and is made particularly for the field of safety and health at work.
