Abstract (en)
[origin: WO2011138084A1] The invention relates to a locator for detecting an article, comprising a push-pull measurement bridge for actuating a first and a second electromagnetic device in a variable ratio, wherein depending on the actuation the first electromagnetic device generates an alternating electromagnetic field in the region of the article. The locator further comprises a comparator for detecting the article, should the variable ratio differ by more than a predetermined amount from a predetermined ratio.
