Abstract (en)
[origin: WO2012041302A2] The invention describes an interactive clock with analogue time display, having an analogue display with a display element, a clock mechanism which is configured to drive a rotation of the display element about an axis of rotation of the analogue display, which rotation is driven by the clock mechanism and is assigned to a unit of time, and a read element which is mounted such that it can be manually rotated about the axis of rotation in such a manner that a manual rotation of the read element leads to a resultant manually forced rotation of the display element or vice versa, wherein the manually forced rotation is superimposed with the clock-mechanism-driven rotation of the display element for the display element, with the result that, in a manually set read position for the read element and the display element, the overall view of the read element and display element displays a current analogue value for the unit of time by virtue of the read element and the display element being arranged in rotation positions with respect to the axis of rotation which are associated with one another.
