Abstract (en)

[origin: WO2011144822A1] The invention relates to a supply device (10) for a machine for transversely cutting two strips (11 and 12) of a flexible material, in particular a strip of paper, moving continuously, to produce separate stacks of documents cut transversely according to predetermined formats. The device comprises a lower driving means (13) and an upper driving means (14) associated with the two strips (11 and 12) of flexible material, respectively, which each include a first roller (13a and 14a) which is mechanically rotated and a second bearing roller (13b and 14b) which is freely rotatable about the axis thereof. To produce stacks that are shifted sideways with respect to each other, so that said stacks can be identified, the driving means are mounted on a frame (15) supported by a movable platform (16) which is rigidly connected to a linear actuator (17) arranged to be moved transversely with respect to the direction of movement of the strips (11 and 12). Optical reading cells (11a, 11b, 12a, 12b) define the operating modes of the driving servomotors (13b and 14b) and the linear actuator (17).
