Abstract (en)

[origin: WO2011144581A1] The invention pertains to a device for trimming the thickness of a mechanical body. The trimming is performed by screwing a screw through a threaded hole and having the end of the screw pressing against the centre of a disk element, which by deformation, acts as a lever against an adjacent body. This reduces the influence of the lead of the screw to the transmission determined by the abovementioned lever.
