Abstract (en)

[origin: WO2011144457A1] The invention relates to equipment comprising a first calculation unit (53) for carrying out an inverse Park transform on the basis of the voltages (U_q and U_d) at the output of the PI current controllers (52), outputting electric-voltage set-point signals (PWMA, PWMB et PWMC) into a power stage (54) powered by a line on which a DC voltage (U_{bus-dc}) is available. The power stage (54) generates a three-phase voltage system (UA, UB and UC) for powering the electric machine (10). The equipment comprises a signal-processing unit (56) that provides an angle measurement (am). A second calculation unit (58) uses the phase currents (Mes IA, Mes IB and Mes IC) and the rotor angle (ar) to output values (MesId and MesIq) used by the first calculation unit (53). A PI voltage controller (60) outputs an angle (ac) for adjusting the setting error by adjusting a set value for the voltage (U_d).
